VP of Engineering · games, real-time products and engineering leadership

PROFESSIONAL SUMMARY

I started as a game programmer and now lead engineering at Decentraland. Across 15+ years, I have built games, real-time products and distributed systems, then grown the teams responsible for them. I also build products through GB Factory, which keeps me close to client and backend architecture, cloud infrastructure and release engineering.

CAREER HIGHLIGHTS

- 15+ years across games, consumer platforms and real-time systems.
- Led technology departments of up to 50 people; current VP scope includes client engineering, Creator Tools and SDK.
- Built and grew distributed teams across startups, live games and global studios.
- Shipped products with Ubisoft, Rovio, Next Games/Netflix Games and Decentraland.
- Built release and management systems that made quality visible and reduced dependency on a few senior people.

SELECTED IMPACT

- At Decentraland, led up to 25 developers across client engineering, Creator Tools and SDK in 10 countries, covering client technology, creator workflows, QA and release delivery.
- Owned 14 Explorer repositories and production distribution across desktop, web and Epic Games Store.
- Led a release system supporting approximately 75 public builds annually, including a recent 52-day period without a hotfix.
- Lowered hardware requirements to open the product to more users by reducing CPU usage, memory usage and GPU memory pressure.
- Removed obsolete technical paths and led performance work toward stable 60 FPS with 100 concurrent users.

WORK EXPERIENCE

VP of Engineering - Decentraland Foundation, London

January 2025 - Present

- Lead the engineering organization and QA; also led Creator Tools and SDK for a period, with peak scope of 25 developers across 10 countries.
- Own technical strategy for 14 Explorer repositories, the Unity/C# desktop client, Launcher/distribution path and desktop, web and Epic Games Store channels.
- Led the client and real-time technical direction for Pulse, moving high-density multiplayer toward server-authoritative infrastructure designed for reliable shared state at ~100-user density.
- Worked directly on Decentraland's distributed asset-bundle converter, using SQS-queued processing and headless Unity workers to transform creator GLTF/GLB assets into optimized client content.
- Led technical direction for the Rust/Tauri desktop Launcher rework, reducing the initial download from 100+ MB to ~1 MB while supporting signed Windows builds and Epic Games Store distribution.
- Directed performance and accessibility work that lowered hardware requirements by reducing CPU usage, memory usage and GPU memory pressure.
- Introduced AI-assisted engineering workflows for code review, QA support and knowledge sharing, including audits that surfaced 45+ dead abstractions.
- Established predictable weekly releases, including a recent 52-day window with zero hotfixes.

Founder & Technical Director - GB Factory Ltd

January 2022 - Present

- Run a small product studio and technical consultancy, building software and helping teams with architecture, performance and release engineering.
- Current work includes Animal Park, a multiplayer mobile game for iOS and Android, plus AI engineering assistants, finance automation and release engineering systems.

Engineering Manager - Decentraland Foundation, London

June 2022 - January 2025

- Grew the client team from ~5 to 10+ engineers and led execution of the new Explorer client that replaced the legacy web client.
- Owned client KPIs including loading time, stability, responsiveness and frame rate, and built the tech-debt program behind them.
- Changed release execution from ad hoc shipping to predictable weekly cadence, monitoring, QA gates, crash reporting, hang detection and performance checks.

Head of Frontend Development - Ten Square Games S.A.

July 2021 - June 2022

- Grew and led the technology department from 25 to 50 people while supporting seven live game teams.
- Modernized lifecycle tooling and drove shared-library adoption so product teams could iterate faster with less duplicated engineering effort.

Technical Manager - Rovio Entertainment Corporation, Helsinki

August 2019 - July 2021

- Led Angry Birds Journey from concept to soft launch and managed, mentored and grew the programming team behind it.

Senior Game Programmer - Next Games Oy (acquired by Netflix), Helsinki

November 2017 - August 2019

- Built core systems, new mechanics and live-ops features for Stranger Things: Puzzle Tales and The Walking Dead: No Man's Land.

Associate Lead Programmer - RedLynx Oy (Ubisoft), Helsinki

September 2016 – November 2017

- Built core systems, real-time synchronous PvP, AI and UI for South Park: Phone Destroyer, and led performance optimization and a small programmer group.

Programmer - RedLynx Oy (Ubisoft), Helsinki

November 2015 – September 2016

- Developed gameplay and systems for South Park: Phone Destroyer from early production using Unity and C#.

SELECTED PROJECTS

AI Assistant

TypeScript / Node.js / Claude Agent SDK / MCP / Telegram / email

- Self-hosted assistant with CLI, private Telegram and email ingress, isolated work/personal profiles, tool permissions, audit logs, calendar integration and safe local file access.

AI Finance Automation

Python / model-agnostic document pipelines / dashboards / finance estimates

- Model-agnostic AI pipelines for finance workflows: documents are read and classified by an LLM, while deterministic code owns every number, dashboard, estimate and reporting package.

Engineering Management Dashboard

GitHub Actions / scheduled agents / Sentry MCP / Unity Cloud costs / dashboard

- Dashboard and scheduled agents for engineering management: releases, CI health, Sentry signals, Unity Cloud cost data, priority reviews, team load and AI-assisted summaries.

EDUCATION

Doctoral studies, Computer Science - Turku & Opole Univ. of Technology (2013 - 2015, not completed)

MSc, Computer Science - Opole University of Technology (2012 - 2013)

BSc, Computer Science - Opole University of Technology (2008 - 2012); exchange year at Vaasa UAS, Finland

RECOGNITION

DirectX 11 Competition

Best Pitch - Startup Journey Demo Day

3 publications: mobile AR, inspection tooling, shooting-sports apps

SPOKEN LANGUAGES

- Polish (native)
- English (professional)
- Finnish (elementary)

EXECUTIVE EXPERTISE

- Engineering strategy & technical vision
- Technical product leadership
- Organizational design & hiring
- AI adoption in engineering teams
- Technical simplification
- Release quality & quality systems
- Technical due diligence & advisory work

ENGINEERING

- Distributed systems & scalable backend architecture
- Horizontal / vertical scaling & capacity planning
- Load balancing, queues & asynchronous processing
- CI/CD & release engineering
- Observability & DevOps
- QA automation & quality gates
- Real-time multiplayer systems
- Performance & reliability
- Product and technical architecture

PROGRAMMING

- C# / Java
- TypeScript / JavaScript / Node.js
- Python
- Rust

AI

- LLM applications & agent systems
- Claude Agent SDK / MCP
- RAG & document pipelines
- AI-assisted development workflows
- Tool permissions & audit trails

PLATFORMS

- Unity / Unreal Engine / Godot
- AWS / Firebase / GCP
- PostgreSQL / Redis / Kubernetes
- Docker, Linux, Proxmox
- GitHub Actions, fastlane
- Sentry / Grafana / Prometheus

DOMAINS

- Real-time systems
- Consumer products
- AI-powered products
- Developer productivity
- Technical consulting
